PNEUMATIC MONOSEM

DIFFERENT TYPES

The PNEUMATIC MONOSEM sowing machine comprises a chassis, a suction turbine and several sowing units with their distribution box. Depending on the seeds to be sown, 2 types of equipment are available :

TYPE n° 1 for maize, sunflower seeds

Number of rows : 2 to 8

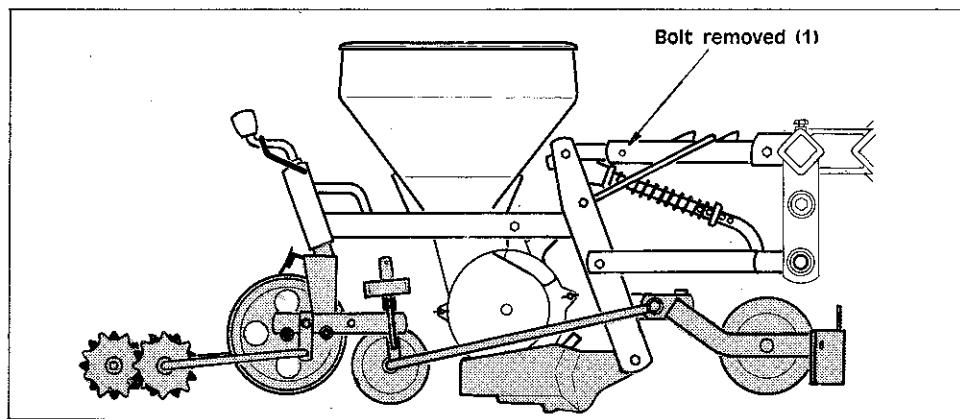

Standard spaces between rows : 50 to 80 cm

Standard spaces between seeds on the row : 10,5 to 26 cm

Working speed 4 to 6 km/h for spacing less than 15 cm

4 to 8 km/h for spacing greater than 15 cm

TYPE n° 2 for sugar-beets, beans, sorghum

Number of rows : 2 to 12

Standard spaces between rows : from 45 to 50 cm

Standard spaces between seeds on the row : 7,5 to 19,5 cm
(from 4,8 cm on request)

Operating speed : 3,4 km/h for spacing less than 15 cm

: 4,5 km/h for spacing greater than 15 cm

FITTING AND OPERATING INSTRUCTIONS

● TURBINE (Fig. A)

When positioning it on the supports (1) and the holes (2) make sure that :

- during lifting, the universal joint neither touches the front square bar, nor the chassis support (to do this, insert the pin located on one of the pillars of this support)
- the length of the universal joint is correct ; if too long it would damage the turbine, if too short there would be too much play

Operation speed : 540 rpm upon tractor power take off

This turbine must be perfectly vertical when in operation : adjust 3 position linkage for this purpose.

● SOWING UNITS (Fig. B.C. and D)

- adjustment of spaces between rows by the screws (2) and bolts (3) loosan sufficiently to move the handle
- adjustment of sowing depth by using the handle (6).
- adjustment of the space between the compressor wheels by using the rings (5) placed either inside or outside of the wheels.
- adjustment of compressor wheels' mud-scraper by using the handle (6)
- adjustment of the maize scrapers (7) by a crank similar to handle (6) however located between the wheels and not visible.
- adjustment of clod guard : it must clear the ground in front of the ploughshare without ploughing furrows
- adjustment of relief spring (8). By compressing the spring, weight is taken off the unit which prevents it from sinking into loose ground
- emptying of the seeds through the hatch (13)
- disengagement of 1 or more units by using the ring (11) which when turned over, with the notches to the outside, no longer drives the distributor.
- a safety system : each unit is fitted with a dog-clutch (9) this comes into operation becomes if the distributor jammed. In this case the unit must be shut off in order to find the fault.

● SEED DISTRIBUTION BOX (Fig. E)

A distribution box includes a body (1) with : a hopper (2), distributor (3), selector (4) and if required an ejector (6), cover (5) and spacer ring (7).

TO DISMANTLE :

- place the unit in an upper, hooked position
- lower the ploughshare
- remove the cover (5) by loosening the wing nuts
- the distributor (3), selector (4), ejector (6) and ring (7) can then be carefully removed. When reassembling make sue to mount all components in the right order.

DISTRIBUTION ADJUSTMENT

The seeds are sucked up and held in the distributor's holes

When the suction is too much two seeds at a time are often taken in

If the suction is too weak not enough seeds are taken in

Suction power therefore has to be adjusted according to the size and weight of the seeds.

For this purpose, a numbered control wheel (8) (fig. F) is mounted on the distribution box.

When this wheel is set to 0 or 1 there is maximum suction, suitable for large seed sizes (maize, beans etc) and pelleted seeds.

When this wheel is set to 3 or 4 there is minimum suction, suitable for light seeds (beet).

Carry out this adjustment in conditions identical to normal operation with the turbine rotating at 540 rpm. With the machine running, correct selection can be checked by means of the cover control window.

DISTRIBUTORS (Fig. G)

A specific type of seed selector disc assembly is available for each of the following types of seed :

- n° 1 for maize (18 segments)
- n° 2 for sugar-beets (24 segments)
- n° 3 for sunflowers (12 segments)
- n° 4 for beans and soya (24 segments)
- n° 5 for sorghum 48 holes in 24 segments)

The distributor is made up of a stainless steel disc, a segment disc, a selector, as well as an ejector for n° 2-3-4 and 5.

• ADJUSTMENT OF SOWING DISTANCES

A main adjustment is carried out on the chassis distance box (fig. H) : after loosening the chain (3) with the lever (4), choose the appropriate pinion ratio (1) and (2) as shown in the table below.

A secondary adjustment is possible with double pinions 19-20 tooth (10/fig. D) which are reversible.

10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26

DISTANCE BOX RATIOS (fig. G)															
18 segments (maize)		19 tooth pinion (fig. D)		8,5	10,5	12	13,5	15	17	19	21	23,5	26,5		
		20 tooth pinion (fig. D)		cm	cm	cm	cm	cm	cm	cm	cm	cm	cm	cm	cm
18	19 tooth pinion	6,5	8	9	10	11,5	13	14	16	18	20	22,5	25	28	
24	19 tooth pinion	7	8,5	9,5	10,5	12	13,5	15	17	19	21				
30	19 tooth pinion	5	6	7	8	9	10,5	11,5	13	14	16				
30	20 tooth pinion	5,5	6,5	7,5	8,5	9,5	11	12	13,5	15	17				
12	19 tooth pinion	13	16	18	20	23	26	28	32	36	40				
12	20 tooth pinion	14	17	19	21	24	27	30	34	38	42				

• NUMBER OF PLANTS PER HECTARE (100 % of germination)

DISTANCES BETWEEN SEEDS IN THE ROWS (in cm)

• FERTILIZER DISTRIBUTORS

Are fitted on the chassis rear square bar as shown in cover photograph.

The flow is adjusted by making the rotation speed of the worm screw vary by using the expandable and double pulleys.

Fertilizer density is very variable, and it is therefore impossible to establish an adjustment table. As a guide, please note that the expandable pulley allows flows varying from 80 to 300 kg/ha when it is used with the small, lower pulley, and varying from 280 to 400 kg/ha when it is used with the large pulley. — When the operation is over, empty and clean completely.

• MICROSEM

Is also fitted on the chassis as shown in cover photograph.

The transfer located on the chain casing indicates the applications as well as adjustments to be made with each product.

Emptying to be carried out each time the machine has to be stopped for several hours.

When the operation is over, complete the emptying by turning the axle manually, to remove any thing remaining in the unit.

Not to be used with powders.

GENERAL MAINTENANCE

Tyre inflation pressure 1 kg/cm² (14 lb/in²)

General lubrication to be carried out once per working day.

Do not forget the various wheel hubs, the chassis bearings, the distance box chains, and the wheel assemblies.

Slightly lubricate rollers, pins and unit chains.

The hubs without visible lubricators are fitted with self-lubricating rings requiring no lubrication.

Use clean seed.

Occasionally open the distribution box to check the inside.

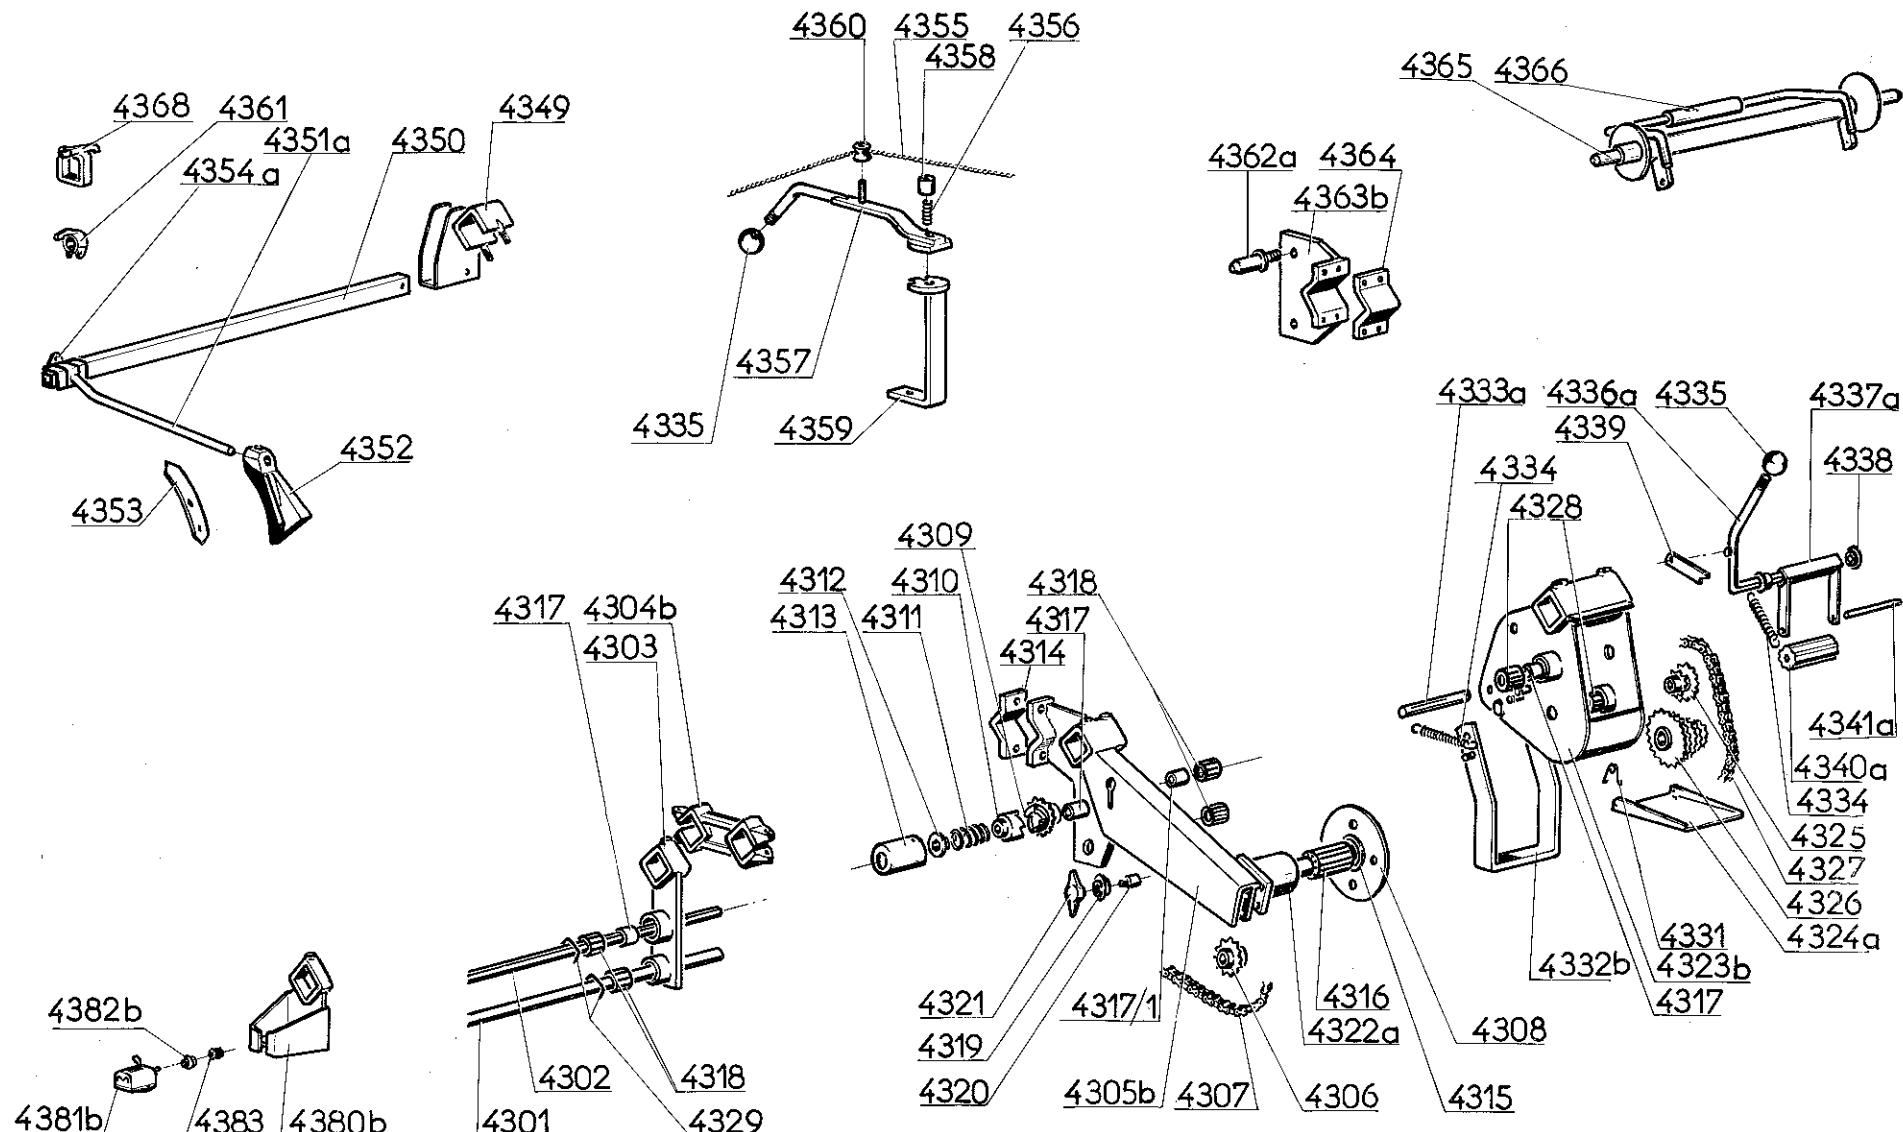

When sowing is over, carry out general cleaning and greasing and keep the sowing machine in a dry, dust-free place.
